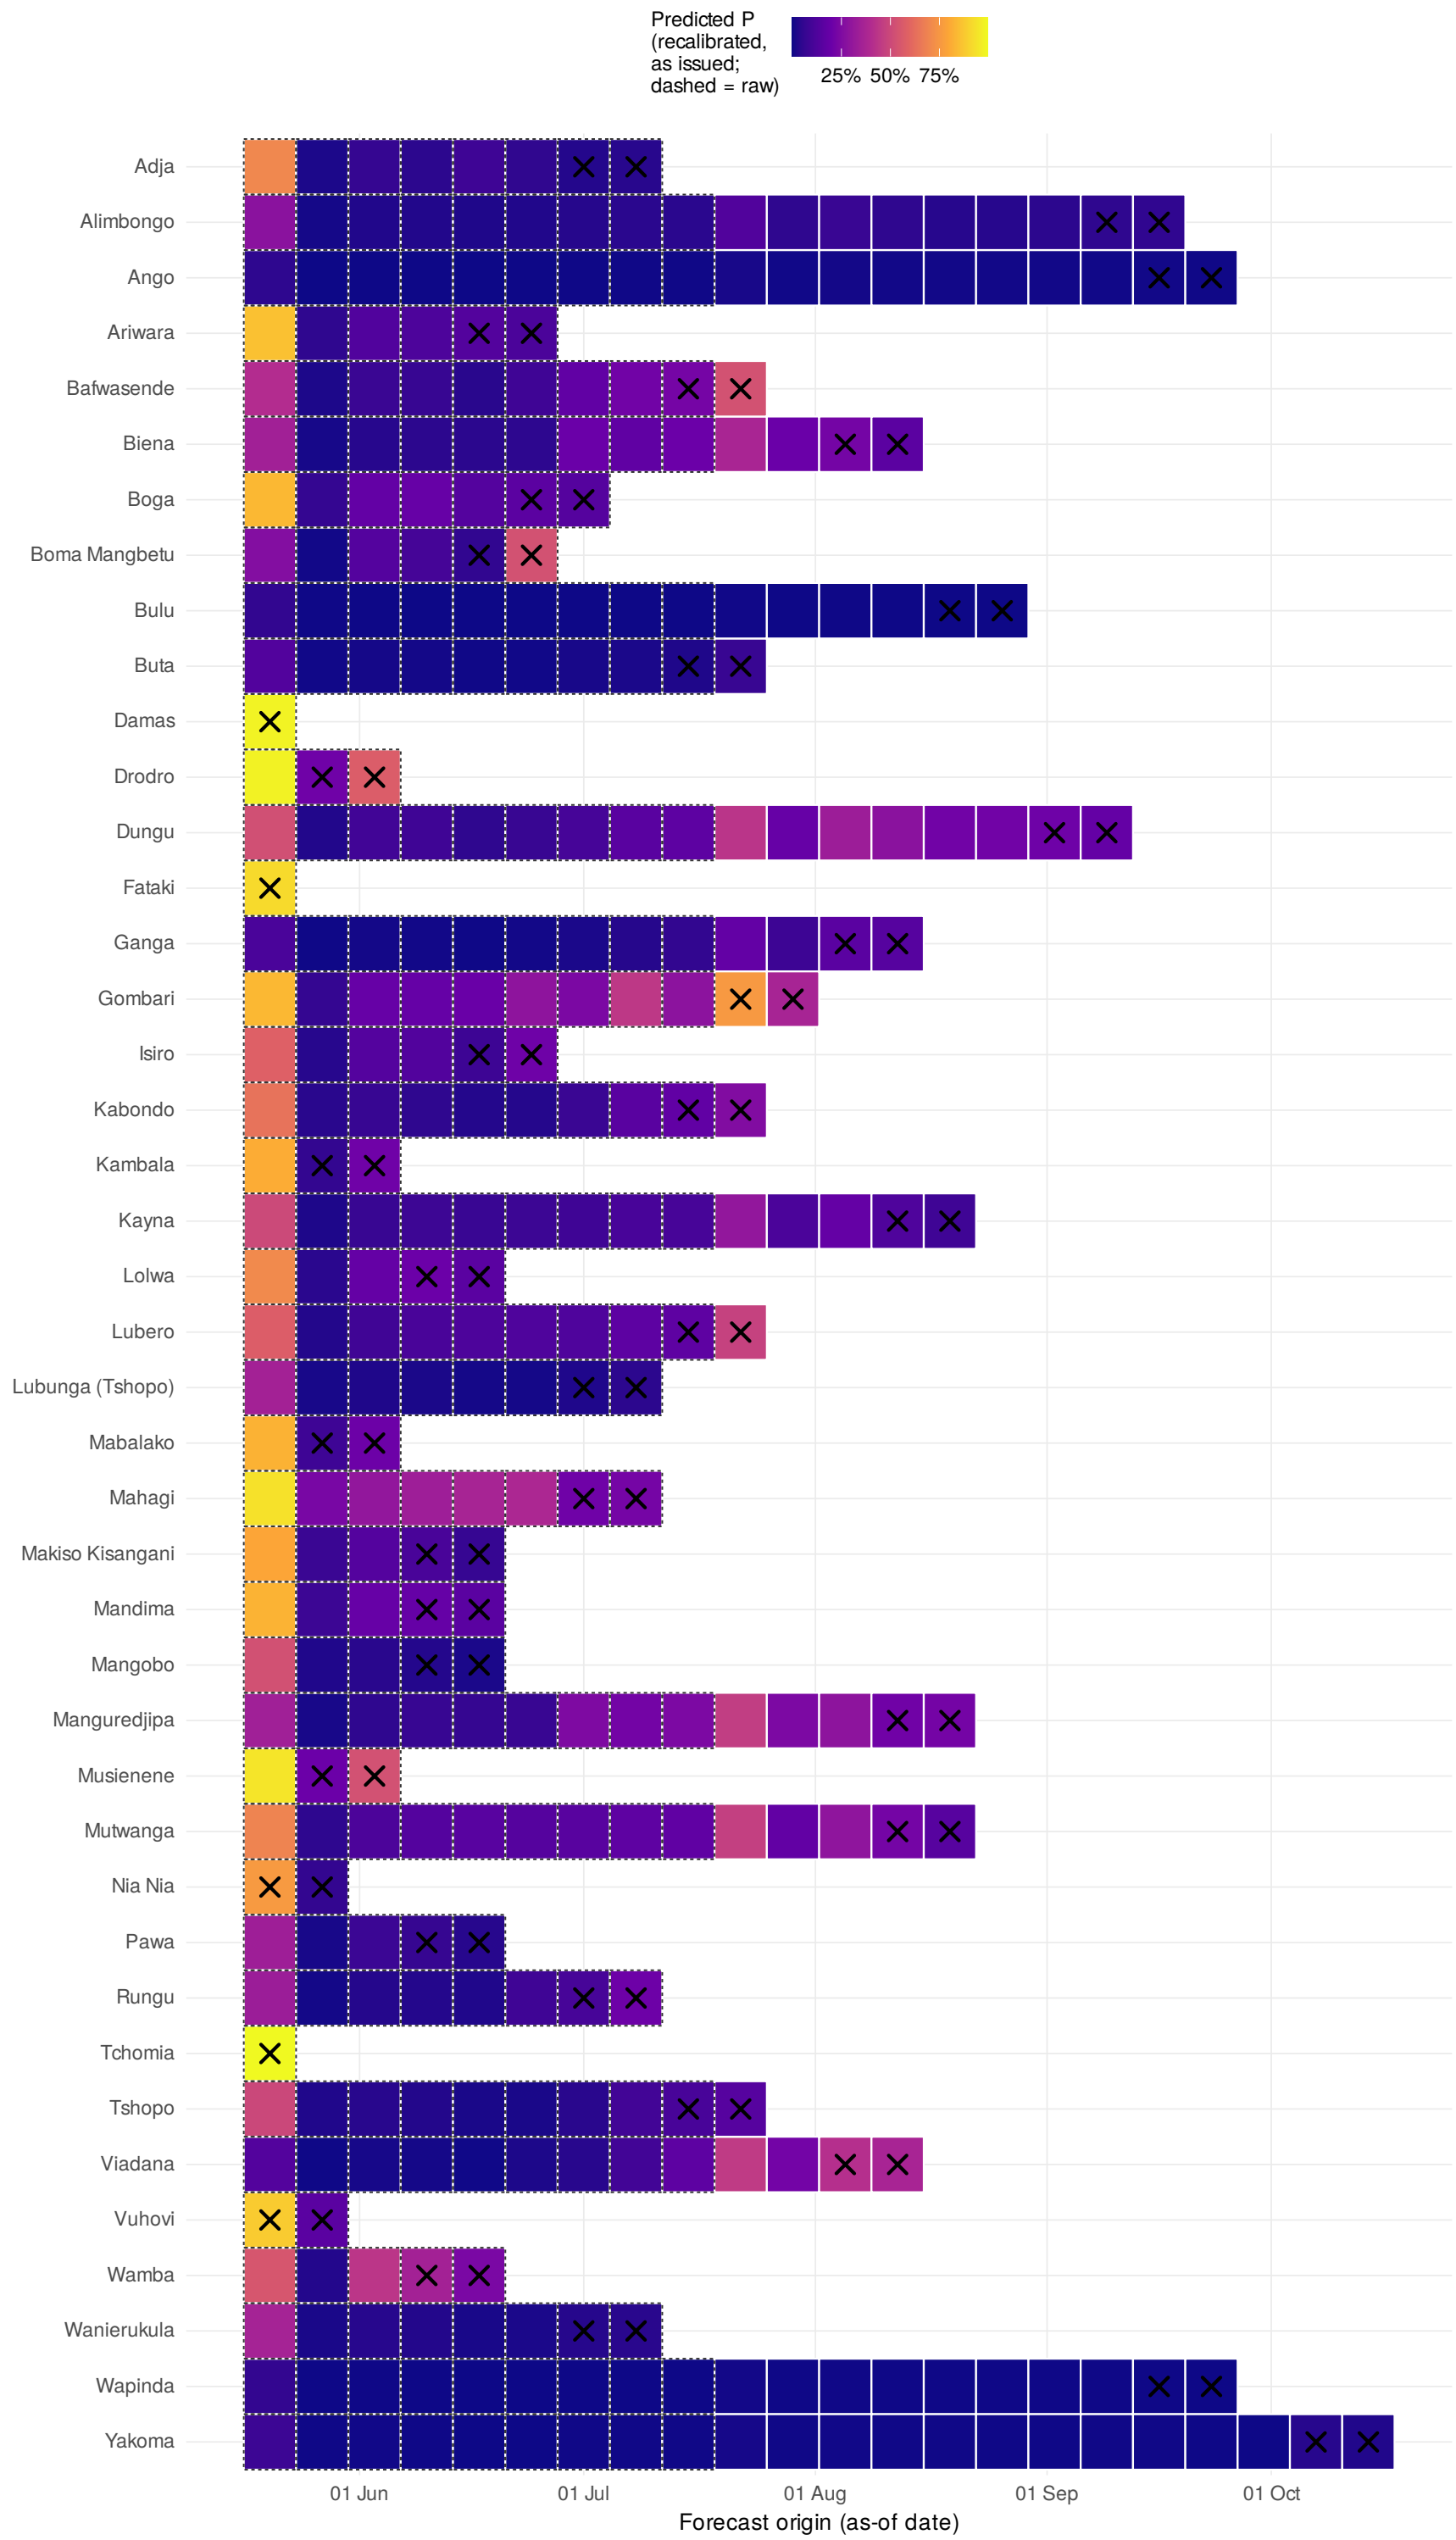
LFO: predicted invasion risk vs realised invasions (Bayes-M14-fill-geo-tvrw1, h=2w)


Rows = zones that were invaded; x = FORECAST ORIGIN; X = a round whose 2-week outcome window contains the zone's first case (windows overlap, so one invasion is marked in up to 2 consecutive rounds). Dashed columns (origins before 22 Jul) carry no fitted recalibration factor yet and are drawn uncorrected (raw).
